data-touch develops, produces and sells touch systems and touch apps using the modular principle: Our multitouch overlay serves as the basic module for cost-efficient and customized touch systems.

The patented universal frame for any type of display comes in four standard sizes: 32, 42, 46 and 55 inch. The unique upgrade-cover with integrated safety glass is available in metal in each RAL colour or high-grade steel with rounded corners and contains an infrared frame either as a dual point or with 6 simultaneous touch points.

Appropriate to all major monitors and PC (plug & play with Windows 7), its fixing is very **flexible**: The system can be mounted on a wall, integrated in an object (e.g. counter) or placed as a stand-alone table, desk or stele.

Due to the manufacturer-independence, our costumers have free choice of components suitable to individual requirements and budget.

According to the versatile hardware options, the easy-to-use **Touch App kiosk software** is based on the modular idea as well: all kind of files and media formats (e.g. pictures, films, presentations, PDF), external applications and standard programs (e.g., websites, games, Powerpoint, WPPF) can easily be integrated into various, combinable TouchApps.

The templates are customizable with own corporate design content, layout and usability are optimised for interactive presentation and operation with all multitouch gestures on large touch-screens.
